All were present

Topics Discussed

The team discussed the user stories to be implemented in Sprint 4 and are as follows:

1. Different picture for each gender (Abishand):
 - a. Each user, when signing up, selects a gender. When viewing their user profile, there should be a single photo per gender.
2. Automated Databases Tests (Tom, Ruochen)
 - a. Tests should be build to test the get/post methods that encapsulate the use of the database. This will consist of sending the appropriate data, and having it processed by the database with a response
3. Polish CSS (Anthony)
 - a. The CSS should make the website look more uniform, and each page should experience a complete overhaul in order to meet this demand.
4. Code Refactoring (All)
 - a. The code should be refactored to match the styles referenced in the git wiki (modular and chain of responsibility)
5. Select Best Answer (Saleh, Anthony, Alex)
 - a. The user who asked a question should be able to pick a single (and one-time) best answer for said question. This is represented as a yellow star if selected as best answer, or else a grey star. Users who are merely reading the question will not see this (unless a best answer was selected)
6. Search (Nizar, Jason)
 - a. The user should be able to search for a question, and have the backend perform a search matching the question titles of all previously posted questions.
7. Re-Vote Functionality (Alex, Saleh)
 - a. The user should be able to change his/her vote after making a previous vote.
