

02/20/2018

Note Taker: Anthony Andreoli

All were present except Tom, Saleh, Nizar, and Ruochen

Topics Discussed

A post-sprint meeting was held in order to determine the next course of action, and to assign new tasks.

- **Voting (Saleh), Score 8 (The most crucial task for sprint 3, aside from creating tests)**
 - A query is needed for creating a new voting row for a newly asked question
 - A query is needed for creating a new voting row for a new answer
 - A query is needed to check if a user has already voted on a question
 - A query is needed to check if a user has already voted on an answer
 - A query is needed to increment/decrement a question vote
 - A query is needed to increment/decrement a answer vote
- **Home Page (Jason), Score: 3**
 - Check that all forms work with the newly divided code
 - Split the *newest* and *popular* into two different pages (two routes)
 - Get the *question_id* for homepage query (See Nizar and Saleh to add this, or do it yourself)
 - Add the *question_id* to the href of each question title in order to allow the user to load the desired question page
 - Remove the # of views from homepage (implementation is too complicated for scope of project)
 - Remove the tags
 - Fix the date in the database (format is too long)
- **Question Forum/Page (Anthony) + General CSS, Score: 5**
 - Better css, up and downvote should be less cumbersome-looking
 - Make pages more uniform
 - Up and downvote should save to database (Use XMLHttpRequest to keep page from refreshing)
 - Query to increment/decrement the # votes (for both questions and answers)
 - Make sure *q_id* in URL is invalid by checking SQL Return (if user types in a manual URL using a question ID that doesn't exist, the user should be redirected to the homepage)
 - User must be logged in, in order to answer a question (cookies must be added for this functionality)
- **Ask (Alex), Score: 5**
 - Make extra page that tells user the question was sent/saved
 - Redirect to the question page
 - Add question score row in the database after a question is asked & saved
 - User must be logged in, in order to ask a question
- **Contact Us (Abishand), Score: 2**
 - Email contact-us information to a central email
- **User-Profile (Anthony + Ruochen + Jason), Score: 5**
 - Make two links for the user profile
 - Get *question_id* from query (which is currently missing), and load it into href in order to link the question title with the forum page for that question.
 - The date format needs to be adjusted (too long right now)

- **Sign-up + Navbar + Login (Anthony), Score: 8**
 - If the user is logged in, the navigation bar should change to display the user name and a sign-out button.
 - This involves the use of cookies, which should be implemented in order for this to work
- **Search (Tom, Nizar), Score: 13**
 - Query needs to return question_ids before the search algorithm is performed
 - The search algorithm needs to be applied to the query results
 - The algorithm needs to return the appropriate objects up the the .ejs file (including question_id to be inserted into the href!!) in order to be displayed and for the user to select & click on (and be redirected to the appropriate forum page once they select their desired question).
- **Make the appropriate user stories for these tasks and include:**
 - Score
 - Risk
 - Priority
- **Email TA to ask what the CI tests consist of**
